

Fail safety principle :
« Bracelets continuously emit a signal which is detected by one or more smartphones with the Sea-Tags app ».

When the Sea-Tags is submerged or too far from the boat, the signal is interrupted. **The phones automatically trigger an alarm and save its GPS position at the time of the incident...**

The Sea-Tags app displays a map **with the position of the man over board and the position of the boat.** In real time, an updated heading and distance towards the man over board are displayed to facilitate recovery operations.

THE + SEA TAGS

- + **AUTOMATIC SMS SENDING*** in order to warn someone...
- + **Can be monitored BY SEVERAL SMARTPHONES...**
- + **Can be used EVERYWHERE...**

*Only the «Text alert mode» needs GSM coverage.
